

# Migratory connectivity analysis

by EURING Migration Atlas

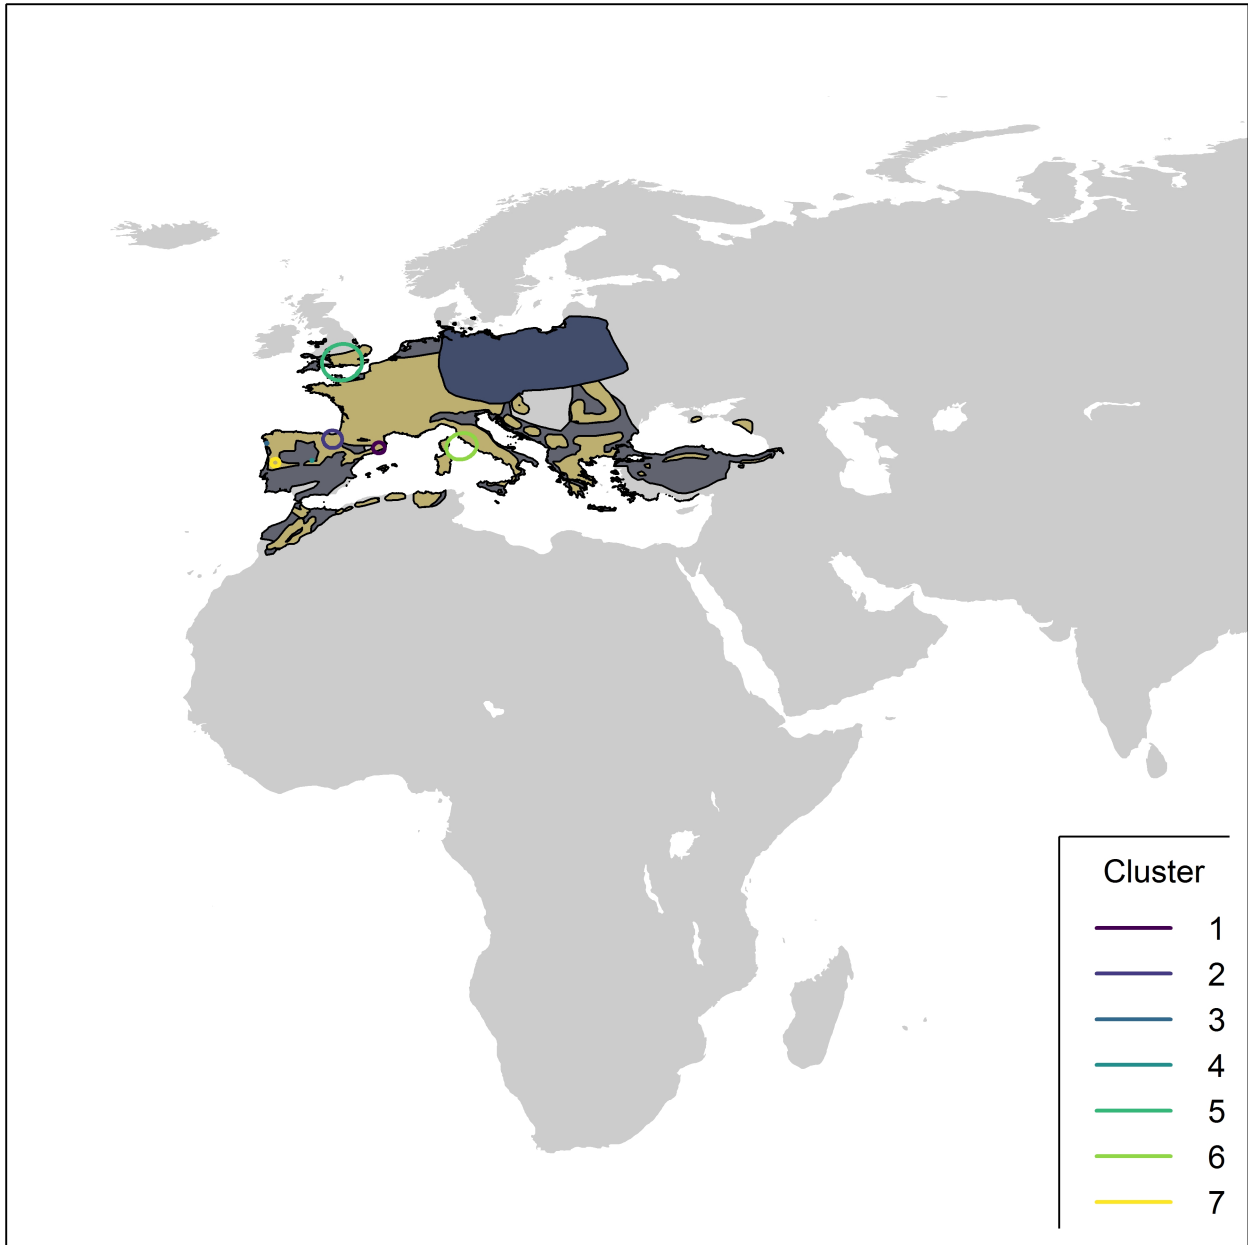

*Regulus ignicapillus* (EURING code 13150)

## 1.1 Connectivity between individuals

The analysis evaluated 36 individuals (72 encounters) filtered from a total of 16286 records in the EURING databank which were considered for the Atlas. The species shows a significant connectivity from clustering, with a number of first-level clusters = 7 (Table 13150-1; Figure 13150-1).

**Table 13150-1.** Results from the migratory connectivity analysis. For each cluster, the degree of connectivity ( $r_M$ ), its statistical significance (p-value) and 95% confidence interval limits are shown. When the p-value is less than or equal to 0.1, the degree of clustering structure (oasw) and the best number of clusters identified are reported.

Cluster name	Level of clustering	N individuals	Migratory connectivity ( $r_M$ )	p-value	Lower 95% confidence limit	Upper 95% confidence limit	Best number of clusters	oasw
0	0	36	1	0.001	1	1	7	0.88
1	1	10	-	-	-	-	-	-
2	1	6	-	-	-	-	-	-
3	1	2	-	-	-	-	-	-
4	1	5	-	-	-	-	-	-
5	1	5	-	-	-	-	-	-
6	1	2	-	-	-	-	-	-
7	1	6	-	-	-	-	-	-

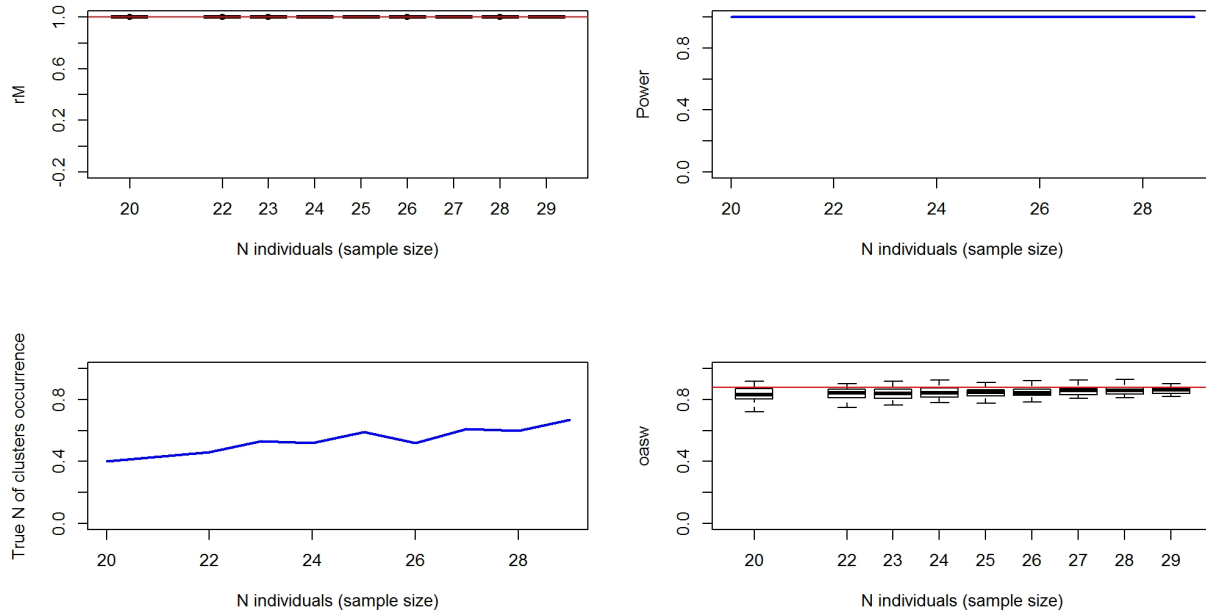

**Figure 13150-1.** Map showing 95% kernel contours of of first-level clusters identified by the migratory connectivity analysis, if any, or 95% kernel contours of all encounters, in case of no clustering structure. Solid lines indicate the clusters in the breeding range, dotted lines those in the non-breeding range. Different contour colours correspond to different clusters, as reported in legend. The species distribution range is also shown (breeding range: blue; non-breeding range: dark grey; resident range: beige; from BirdLife International, 2019).

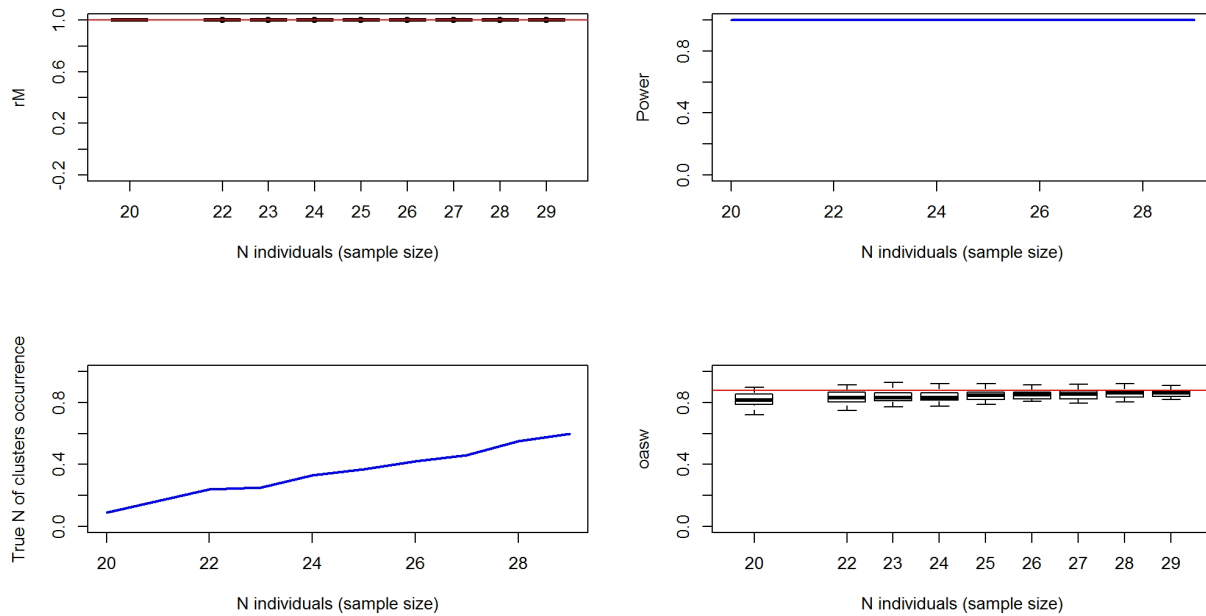

### 1.2 Sensitivity analysis

Results of power analysis and validation. Analyses at the species level were re-run on subsamples of individuals of decreasing size (100 repetitions per subsample size), according to simple random sampling of individuals (Figure 13150-2) and stratified sampling of individuals within the breeding range (Figure 13150-3) and the non breeding range (Figure 13150-4). For stratified sampling, we selected individuals with a

probability inversely proportional to the number of observation in each country. Figures below report the results of the procedure.

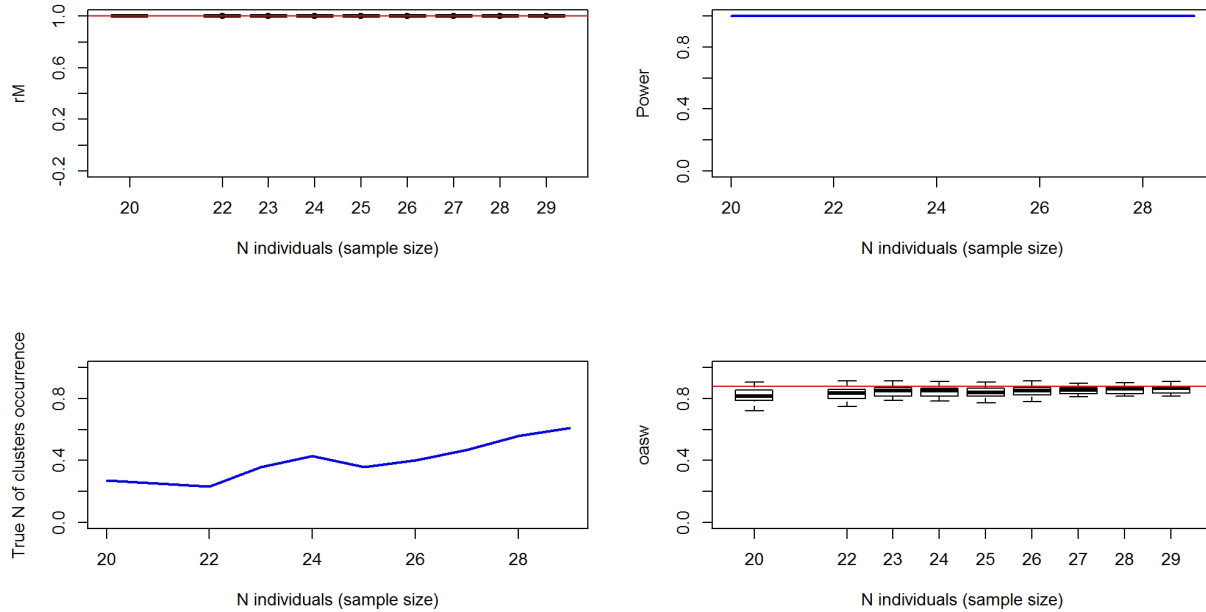

**Figure 13150-2.** Top left: simulated distribution (boxplots) and observed value (red line) of connectivity. Top right: Simulated power of the analysis (i.e. proportion of times the analyses on the subset of individuals was significant). Bottom left: Proportion of times the analysis provides the observed best number of cluster. Bottom right: simulated distribution (boxplots) and observed value (red line) of clustering intensity.

**Figure 13150-3.** Top left: simulated distribution (boxplots) and observed value (red line) of connectivity. Top right: Simulated power of the analysis. Bottom left: Proportion of times the analysis provides the

observed best number of cluster. Bottom right: simulated distribution (boxplots) and observed value (red line) of clustering intensity.

**Figure 13150-4.** Top left: simulated distribution (boxplots) and observed value (red line) of connectivity. Top right: Simulated power of the analysis. Bottom left: Proportion of times the analysis provides the observed best number of cluster. Bottom right: simulated distribution (boxplots) and observed value (red line) of clustering intensity.

## 2. Connectivity between pre-defined regions

The species shows high connectivity ( $MC = 1$ ;  $MC = 1$  when adjusted for absolute abundance) between 3 breeding regions and 3 non breeding regions (Table 13150-2; Figure 13150-6).

**Table 13150-2.** Transition probabilities between pre-defined regions. Estimated abundance (number of individuals) in each breeding region is also reported.

Breeding region	Abundance	Non breeding region	Transition probability
North-west Europe	1100	North-west Europe	1
South-central Europe	1594492	South-central Europe	1
South-west Europe	3500479	South-west Europe	1

**Figure 13150-6.** Map showing pre-defined regions in different colours, with black arrows linking centroids of individual encounters in different regions. Arrow width is proportional to transition probability.
